PUBLIC CONTRIBUTIONS (SELECTED)

2026-Present	Maintainer of the LLVM Pass Template , a C++ template project to quickly create new LLVM passes. This project allows developers to quickly bootstrap, test, and benchmark new out-of-tree LLVM passes with minimal effort — that is, without the need to build LLVM from sources.
2026/06/09	LLVM (MLIR) : affine-super-vectorize now emits in_bounds transfer ops Fixes affine-super-vectorize to emit vector.transfer_read/write with the in_bounds attribute when statically provable, avoiding unnecessary masked intrinsics overhead on AArch64/NEON.
2025-Present	Maintainer of the Papers on Compiler Optimizations: Analysis and Transformations , a curated list of scientific publications on compiler optimizations and related topics. This repository curates a chronologically sorted list of influential papers on compiler optimization, from the seminal works of 1952 through the advanced techniques of 1994.
2025/09-Present	Maintainer of scribe , a minimalist, opinionated LaTeX document class for academic technical writing and presentations. Scribe provides a clean, professional layout with callout boxes, theorem environments, line numbering, and a matching Beamer theme.
2025-Present	Maintainer of the Tide Compiler , an backend-agnostic IR and compiler framework written in Rust . Tide aims to be a modular and extensible framework for building compilers and language tools, prioritizing simplicity and ease of use. From its quasi-SSA IR to its flexible backend architecture, Tide provides a solid foundation for developing compilers for various programming languages.
2025-Present	Contributions to the Rustworkx graph library, focusing on implementing the Closeness Centrality algorithm for weighted graphs (following Newman's method) and integrating it into the Python bindings. • Generalizing Closeness centrality to weighted networks using Newman method (issue 1384)
2024-Present	Maintainer of the cross-platform tgt project and tdlib-rs TDLib bindings written in Rust . Tgt is a TUI (Terminal User Interface) client for Telegram, built using the tdlib-rs library, which provides safe and idiomatic Rust bindings to the official TDLib (Telegram Database Library) C++ library. Thanks to CI/CD pipelines, we ensure (i) that the projects build and work correctly on Linux, macOS, and Windows, (ii) automatic releases on GitHub and crates.io, and (iii) automatic documentation generation.
